Product owners, software developers, and Scrum Master are set and ideally don't change over time; the critical part is the Release Manager role you need to define here						

<b>Goals 1</b>	
	Completing the objective and task given by our IP, becoming a well rounded team in the meantime
<b>Meeting norms 2</b>	Be punctual (with a 5min pardon time)
	Max. two times missing from IP meeting
	not having the camera off two consecutive times
<b>Working norms 2</b>	Don't push to main, keep main in working order
	Dependencies are a team effort
	all tests must pass
	criticism via pull/merge requests
<b>Coordination norms 2</b>	PR with one other member
	max keeps meetings on track
<b>Communication norms 2</b>	communication via discord - team meeting via zoom
	document major changes
<b>Consideration norms 2</b>	be respectfull
	small disagreement, discuss and vote
<b>Cont. improvement norms 2</b>	team meeting for tracking team's progress -> standup emails for gathering intel
	pushing non functional changes will trigger a workshop
<b>Rewards 1</b>	have cake together
<b>Sanctions 1</b>	Others choose a random virtual background
<b>Signatures</b>	
Scrum Master	Maximilian Krug
Product owner	Mohammed Tamim Ayach
Product owner	Ali Nawlo
Software developer	Luca Bretting
Software developer	Benedikt Zinn
Software developer	Christos Labroussis
Software developer	Robin Seidl
Software developer	Franz Schlicht
Software developer	Felix Hilgers
Software developer	Tom Weißhuhn
	<a href="https://oss.cs.fau.de/wp-content/uploads/2014/04/Team-Contract-Explanation-and-Examples.pdf">https://oss.cs.fau.de/wp-content/uploads/2014/04/Team-Contract-Explanation-and-Examples.pdf</a>

Product Vision	Project Mission
<p>In systems with a high frequency of component changes, it is difficult to determine which component might be causing performance issues and affecting the entire system negatively. This is especially hard if the source code and/or build environment for the components is not present as they might be coming from external suppliers, which means they cannot easily be instrumented. This can result in a lot of communication and extra work.</p> <p>Using eBPF allows for tracking some of these issues at the kernel level, where for example blocking calls are made and can be tracked. It allows for hooking into Sys-Calls as well as calls to other userspace or kernel-level functions (uprobes and kprobes), all without needing to modify application code. This makes it possible to track down cross-cutting performance issues without needing additional support from the vendor of the component.</p> <p>The information about, for example the length of a blocking calls, can then be passed to various frontends, such as an Android application running on the target hardware or an external sink for displaying the data in visualization software like Grafana.</p>	<p>ZIOFA (Zero Instrumentation Observability for Android) aims to implement observability use cases relevant to performance specified by our industry partner using eBPF. Examples include tracing long-running blocking calls, leaking JNI indirect references or signals like SIGKILL sent to processes, all without instrumenting the observed application itself.</p> <p>The eBPF programs are loaded and unloaded using a backend daemon running as root that will collect metrics and send them to a client. For displaying these metrics to the user, we are implementing an on-device UI that can display visualizations for these use cases and allow for configuration of the enabled use cases, but using a decoupled Client SDK so that future work may easily make the data accessible the external processing.</p>

Term	Definition

Sprint #	Sprint goal
1	None
2	None
3	None
4	Optional
5	Working, loading, and unloading of eBPF Programs from UI all the way to eBPF
6	Analyzing traffic over Unix Domain Sockets
7	Analyzing user space function calls
8	Finalizing User space function calls
9	Improve Testing and Finalize previous work
10	
11	
12	
13	
14	
15	

Sprint	Goal	Feature Name	Est. Size	Est. Remaining	Real Size	Real Remaining
Release						
Total			63	63		
Sprints						
1	Get to know the Team		8	63	6	63
2	Get familiar with eBPF and other required technologies.		8	55	6	57
3	Start Developing, have a UI blueprint and a Backend beginning		13	47	12	51
4	Build a UI and work with Ebpf		12	34	11	39
5	Working, loading, and unloading of eBPF Programs from UI all the way to eBPF		13	22	12	28
6	Analysing traffic over Unix Domain Socket		9	9	9	16
Features						
1	Get to know the Team					
		Brain-storm Architecture	3		1	
		Preperation of Kotlin	3		3	
		Brain-storm ebpf use cases	2		2	
2	Get familiar with eBPF and other required technologies.					
		Docker Container	3		3	
		get information about android processes to list them	3		1	
		set aarch64 als target	1		1	
		use android 13 instead of 15	1		1	
3	Start Developing, have a UI blueprint and a Backend beginning					
		Preparation of CI	3		3	
		find timeseries visualization library	2		2	
		Sbom generation	2		1	
		Generation of sboms doesn't include kotlin	1		1	
		Communcation between Android side and Rust side	5		5	
4	Build a UI and work with Ebpf					
		unix domain socket traffic analysis (research)	5		3	
		Home Screen and Navigation Drawer	2		3	
		EBPF Program extension to load kProbes	3		3	
		Implement frontend load and list programs	2		2	
5	Working, loading, and unloading of eBPF Programs from UI all the way to eBPF					
		kotlin interface for frontend loading and listing programs	1		1	
		test cli client: load and list programs	3		2	
		client library exported to kotlin	2		1	
		Running processes List	3		3	
		loading/unloading of ebpf functions in daemon	2		3	
		Display Installed Proceses in UI	2		2	
6	Analysing traffic over Unix Domain Socket					
		collecting unix domain sockets events	2		2	
		configuring unix domain socket tracing	2		2

How to play planning poker							
1. Everyone type their number into their value field, don't hit return yet							
2. Someone, perhaps a product owner, count down 3.. 2.. 1..							
3. Then, everyone hit return to submit their value
