Goals 1	
	Completing the objective and task given by our IP, becoming a well rounded team in the meantime
Meeting norms 2	Be punctual (with a 5min pardon time)
-	Max. two times missing from IP meeting
	not having the camera off two consecutive times
Working norms 2	Don't push to main, keep main in working order
	Dependencies are a team effort
	all tests must pass
	criticism via pull/merge requests
Coordination norms 2	PR with one other member
	max keeps meetings on track
Communication norms 2	communication via discord - team meeting via zoom
	document major changes
Consideration norms 2	be repectfull
	small disagreement, discuss and vote
Cont. improvement norms 2	team meeting for tracking team's progress -> standup emails for gathering intel
	pushing non functional changes will trigger a workshop
Rewards 1	have cake together
Sanctions 1	Otheres choose a random virtual background
Signatures	
Scrum Master	Maximilian Krug
Product owner	Mohammed Tamim Ayach
Product owner	Ali Nawlo
Software developer	Luca Bretting
Software developer	Benedikt Zinn
Software developer	Christos Labroussis
Software developer	Robin Seidl
Software developer	Franz Schlicht
Software developer	Felix Hilgers
Software developer	Tom Weißhuhn

## **Product Vision Project Mission** ZIOFA (Zero Instrumentation Observability for Android) aims to implement In systems with a high frequency of component changes, it is difficult to determine which component might be causing performance issues and affecting the entire observability use cases relevant to performance specified by our industry partner system negatively. This is especially hard if the source code and/or build environment using eBPF. Examples include tracing long-running blocking calls, leaking JNI indirect for the components is not present as they might be coming from external suppliers, references or signals like SIGKILL sent to processes, all without instrumenting the which means they cannot easily be instrumented. This can result in a lot of observed application itself. communication and extra work. The eBPF programs are loaded and unloaded using a backend daemon running as Using eBPF allows for tracking some of these issues at the kernel level, where for root that will collect metrics and send them to a client. For displaying these metrics to example blocking calls are made and can be tracked. It allows for hooking into Systhe user, we are implementing an on-device UI that can display visualizations for these use cases and allow for configuration of the enabled use cases, but using a Calls as well as calls to other userspace or kernel-level functions (uprobes and kprobes), all without needing to modify application code. This makes it possible to decoupled Client SDK so that future work may easily make the data accessible the track down cross-cutting performance issues without needing additional support from external processing. the vendor of the component. The information about, for example the length of a blocking calls, can then be passed to various frontends, such as an Android application running on the target hardware or an external sink for displaying the data in visualization software like Grafana.

amos2024ws03-planning-document Definition of Done

#	Feature Definition of Done	Sprint Release Definition of Done	Project Release Definition of Done
	1. Code for Components has been written. a. The code does comply to the naming conventions of the used programming language b. Code has been completed c. Unclear code parts are provided with a short comment, to explain what this part is supposed to do. 2. Developers submit a screenshots of the finished feature as a comment to the related issue 3. Feature has been reviewed by another team member 4. Feature has been merged and closed	1. Finished issues are marked as done 2. Code is tested and deployed 3. A short demo is available for each sprint (this is compliant with point 3 in DoD for Feature) so it can be the screenshots or a small video or even a short-live presentation 4. Bill of Material is kept in a current state	Team agrees on which features to be released     Features have been tested and reviewed by other team member     Documentations are kept updated     A short demo featuring major features is provided
